講師： Ying Zhang 氏 (天津大学)

演題： A simple quantum many-body system – neutron drop

日時： 6月26日(金) 15:00～

場所： (※オンラインセミナー)

## 概要

A neutron drop is a system composed only of neutrons trapped by artificial external fields [1]. This simple system can be easily calculated by both the ab initio approach and energy-density functional theory. Therefore, the ab initio solutions for a neutron drop can be used as pseudo-data to calibrate and improve the effective Hamiltonians and density functionals in nuclear physics [2,3]. In this seminar, I will introduce our investigation on neutron drop by using the energy-density functional theories, including the following aspects: the origin of the spin-orbit and pseudospin-orbit splittings' evolution in neutron drop; the pairing [4] and the deformation effects on the neutron drop.
